FashionWave Sales Analysis Report

Retail Store Sales Analysis

INTRODUCTION

FashionWave is a mid-sized retail chain operating 50 stores across India. The company has experienced stagnant weekend sales while weekday sales remain stable. This report analyzes two years of transactional data to understand sales drivers, evaluate discount strategies, and improve overall profitability.

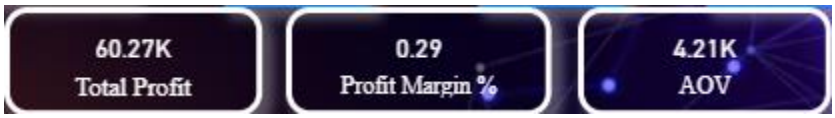
EXPLORATORY DATA ANALYSIS (EDA)

The dataset includes invoice-level transactions with attributes such as date, store, product category, quantity, pricing, discount, and customer type. EDA involved checking data quality, validating discount limits, understanding sales distribution, and identifying seasonal and weekend patterns.

Here, I have created the slicer where I just converted it in to dropdown of two years 2024 and 2025 for enabling user the partition the data year wise and after selecting the particular year that year whole month will open and when you select the desired month of that year then all the data on dashboard will converted and display on the basis of that month such as

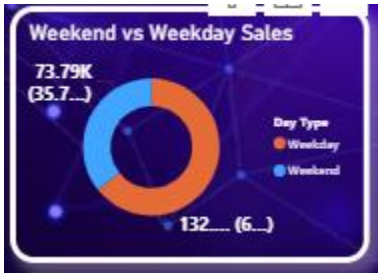
Total Sales of 2024 January month

And Total Profit, Profit Margin, Average Order Value (AVO)



And there are other matrixes as well which is displayed as per the selected month of a particular year and they are :

This is the customer segmentation which shows the percentage of new customers came in that month and the existing customer which return back and make a purchase then

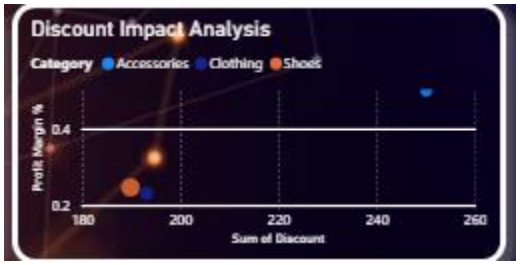


It shows Weekend and Weekday sales of that particular selected month in this case it is January.

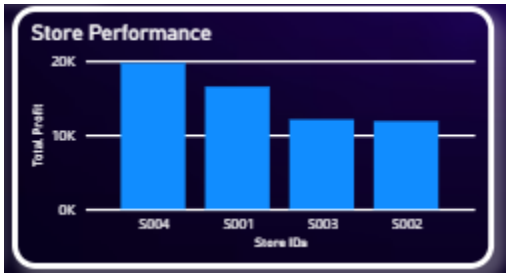
It also shows the Total Sales, Total Profit and Profit Margin as per the Category but for that you have to also select the particular category from the category slicer.

In this chart it also shows the units sold by category in that particular selected month of already selected year.

Here you can see that it also shows the total sales by month and as you can see it is displaying the sales of January month of year 2024.



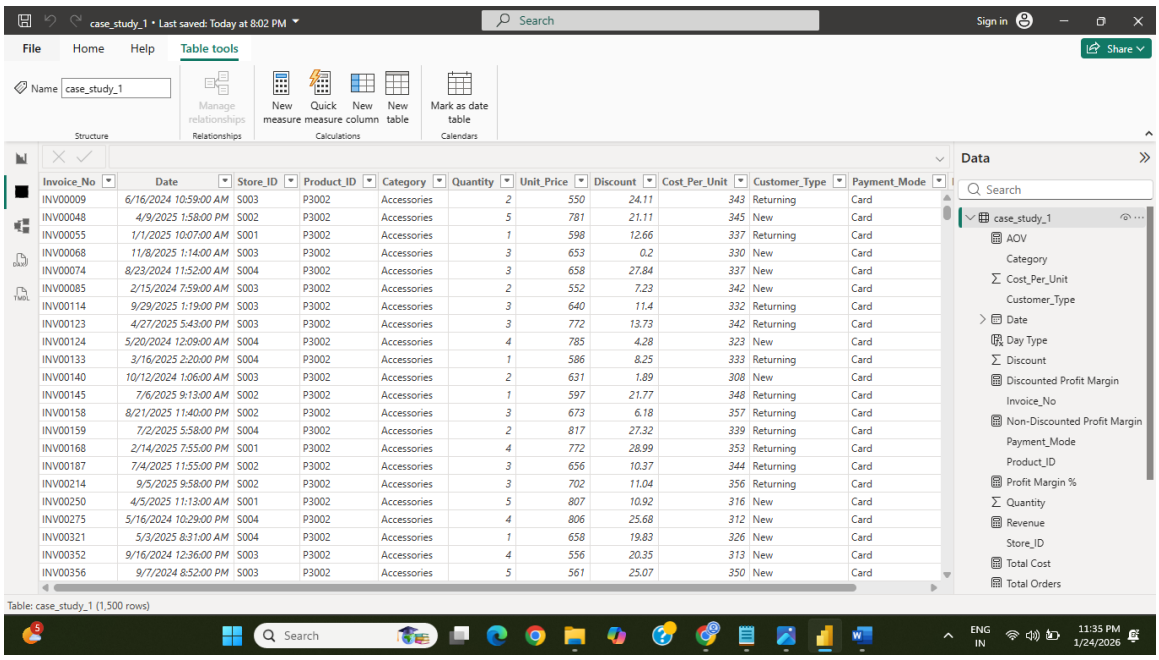
In this chart you can see that it also displays profit margin % along with the discount over the category selected



In this chart you can easily see the profit made by each store and you can further filter this dashboard via selecting the particular spectrum over each slicer such as this

METHODS

Power BI was used for data modeling and visualization. DAX measures were created for Total Sales, Total Profit, Profit Margin, Average Order Value, and Weekend vs Weekday Sales. Slicers enabled dynamic filtering by date, store, category, customer type, and payment mode.



Invoice_No	Date	Store_ID	Product_ID	Category	Quantity	Unit_Price	Discount	Cost_Per_Unit	Customer_Type	Payment_Mode

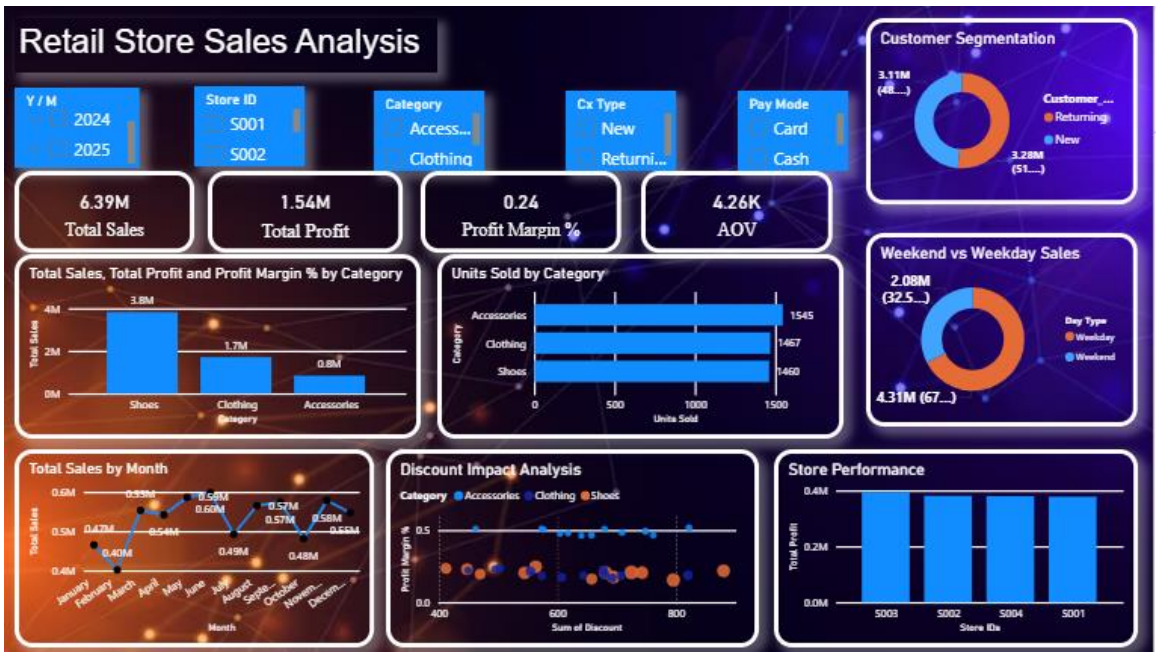
DASHBOARD & RESULTS

The dashboard presents KPI cards, sales trends over time, store performance comparisons, category-level profitability, and discount impact analysis. Results indicate consistent weekday performance and fluctuating weekend sales, with notable variation across stores and categories.



INSIGHTS

- Weekend sales lag behind weekday sales.
- High discounts reduce profit margins in some categories.
- Returning customers generate higher average order values.
- A subset of stores consistently underperform in profit contribution.

Weekend sales lag behind weekday sales

What this means

Although weekends are expected to be high-traffic periods, the data shows that **total sales** and transaction volume are consistently lower on weekends compared to weekdays.

Why this might be happening

- Customers may browse more on weekends but postpone purchases

- Store footfall may be high, but conversion rates are low
- Lack of targeted weekend-only offers or promotions
- Staffing or inventory limitations during weekends

Why it matters to the business

Weekends represent a missed revenue opportunity. Improving weekend performance can significantly boost overall sales without increasing store count.

High discounts reduce profit margins in some categories

What this means

Certain product categories show strong sales volume but weak profitability because higher discounts directly reduce profit margins.

Why this might be happening

- Aggressive discounting to push sales
- Price-sensitive categories relying on promotions
- Discounts applied without considering cost structure
- Uniform discount strategy across all products

Why it matters to the business

Higher sales do not always mean higher profit. Uncontrolled discounting can erode margins, making some categories unprofitable despite good revenue.

RECOMMENDATIONS

Quick Wins:
Target weekend promotions for high-margin products.
Optimize discount levels to protect profitability.

Weekend promotions should focus on high-margin products to increase sales without sacrificing profitability.

Limited-time weekend offers can improve conversion rates when customer traffic is high.

Discounts should be optimized, not maximized, ensuring they drive sales while maintaining healthy profit margins.

Reducing heavy discounts on low-margin categories helps prevent profit erosion.

These actions can deliver immediate impact with minimal operational changes.

Long-term Strategies:
Implement customer segmentation-based offers.
Customize store-level strategies based on performance insights.

Customer segmentation enables personalized offers based on purchasing behavior and value.

Targeted promotions improve customer retention and average order value over time.

Store-level performance analysis allows strategies to be tailored for local market conditions.

Underperforming stores can be supported with optimized pricing and product mix.

These strategies ensure sustainable growth and long-term profitability.

CONCLUSIONS

This analysis demonstrates how leveraging data-driven insights can help FashionWave move beyond intuition and make informed business decisions. By identifying gaps in weekend performance, understanding the true impact of discounting on profitability, and recognizing the value of returning customers, the company can focus its efforts where they matter most. Strategic optimization of discounts, category-level focus on high-margin products, and targeted store- and customer-specific actions provide a clear roadmap to improve weekend sales and strengthen overall profitability. Implementing these recommendations will enable FashionWave to drive sustainable growth while maintaining long-term financial health.
